	<p>Cold Front - a zone separating two air masses, of which the cooler, denser mass is advancing and replacing the warmer.</p>
	<p>Warm Front - a transition zone between a mass of warm air and the cold air it is replacing.</p>
	<p>Stationary Front - a front between warm and cold air masses that is moving very slowly or not at all.</p>
	<p>Occluded Front - a composite of two fronts, formed as a cold front overtakes a warm or quasi-stationary front. Two types of occlusions can form depending on the relative coldness of the air behind the cold front to the air ahead of the warm or stationary front. A cold occlusion results when the coldest air is behind the cold front and a warm occlusion results when the coldest air is ahead of the warm front.</p>
