Parkinson's disease is caused by the loss of dopamine-producing cells in the brain. Dopamine is a neurotransmitter that helps control movement. When dopamine levels decrease, it can lead to the development of Parkinson's disease symptoms.

The symptoms of Parkinson's disease can vary from person to person, but they typically include:

- Tremor
- Bradykinesia (slowed movement)
- Rigidity (stiffness)
- Postural instability (balance problems)
- Speech problems
- Cognitive problems
- Depression

There is no cure for Parkinson's disease, but there are treatments that can help to manage the symptoms. These treatments include medication, surgery, and physical therapy.
